pattern in original size

background:
85 385 00 mirror bevel 25,4 cm x 10,80 cm

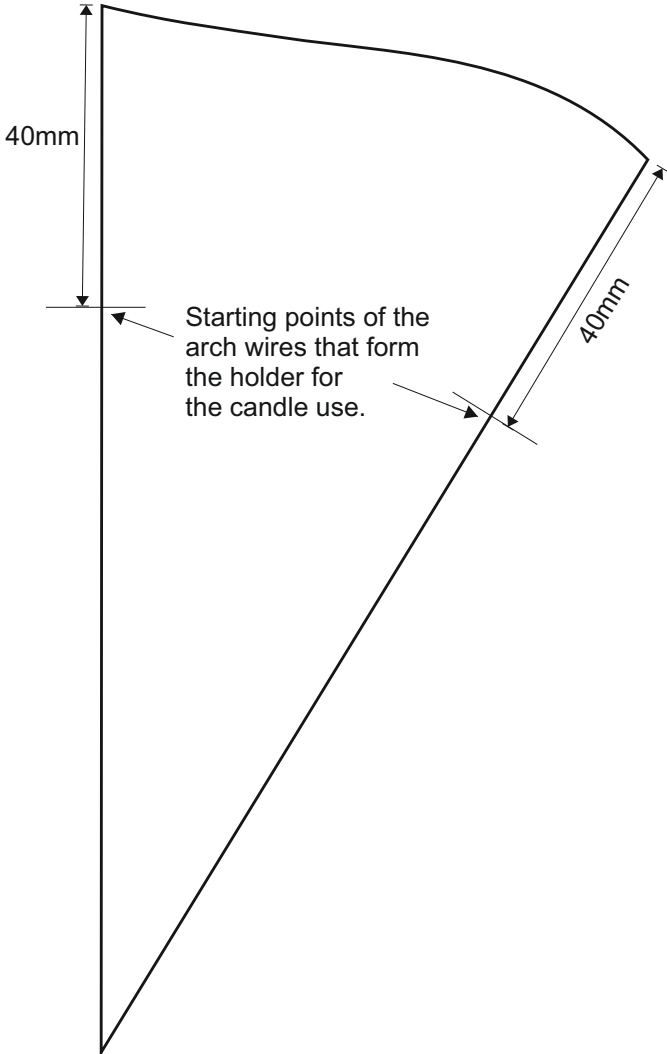

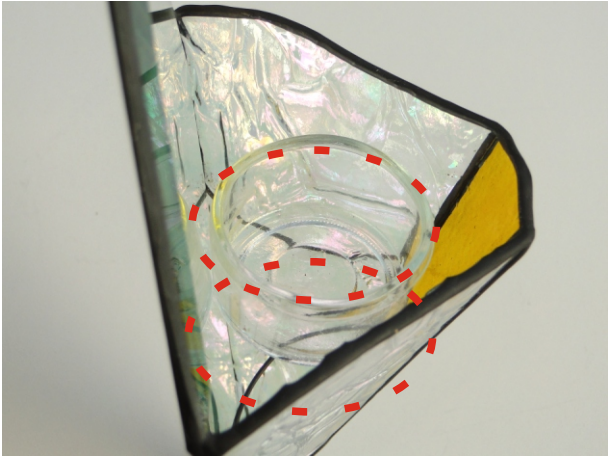

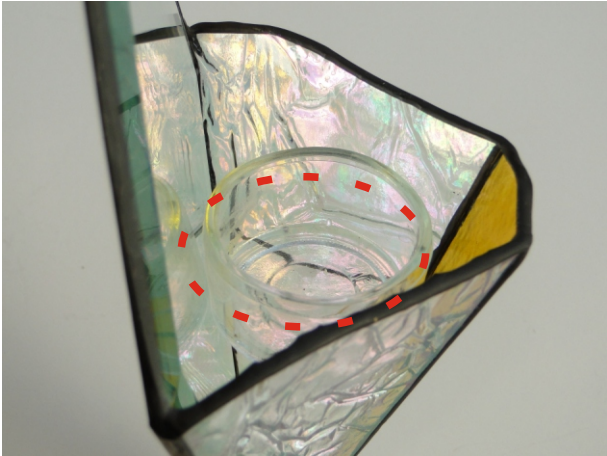

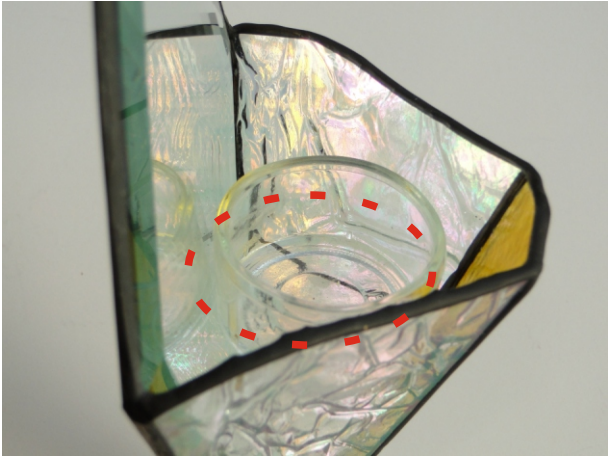

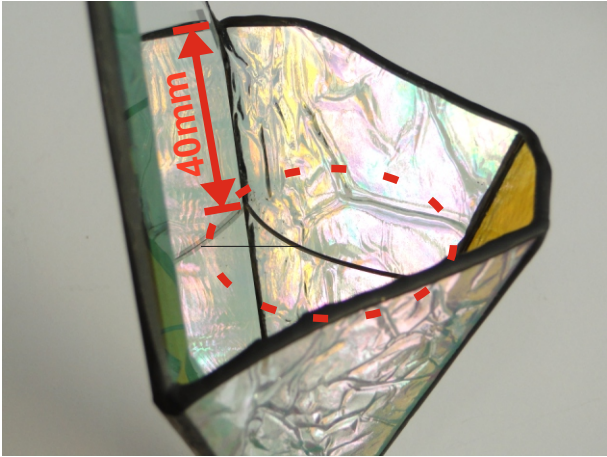

Reinforce the construction
by a soldered wire .
The wire forms up at the
end the loop as a hanger.

Leave a small hole in the below.
Thus rainwater can run off easily when
you want to hang wall light outside.

I recommend to coat the cutting edge with
mirror protective lacquer before
foiling to be brushed

Also, it makes sense to let the copper foil
overlap on the coated side a little wider.

The images above show the holder for the candle. From 1mm thick brass wire, bend two arches. These bows solder in such a way that they result in a horizontal standing surface for the tea light.

A great wall of light on balcony.
